# What is this Bot?

Data extractor is a specialized bot of Agile Managex Technologies (AMT). It extracts the required data from various sources and uploads it to the destination file, for example an excel sheet, within no time. It saves valuable time, organizational resources, and helps the organization complete other critical tasks which cannot be performed without human interaction. To achieve high level of employee productivity, enhanced process efficiency and competitive advantages over your rivals in the market, all you have to do is introduce and implement our data extractor bot in your company.

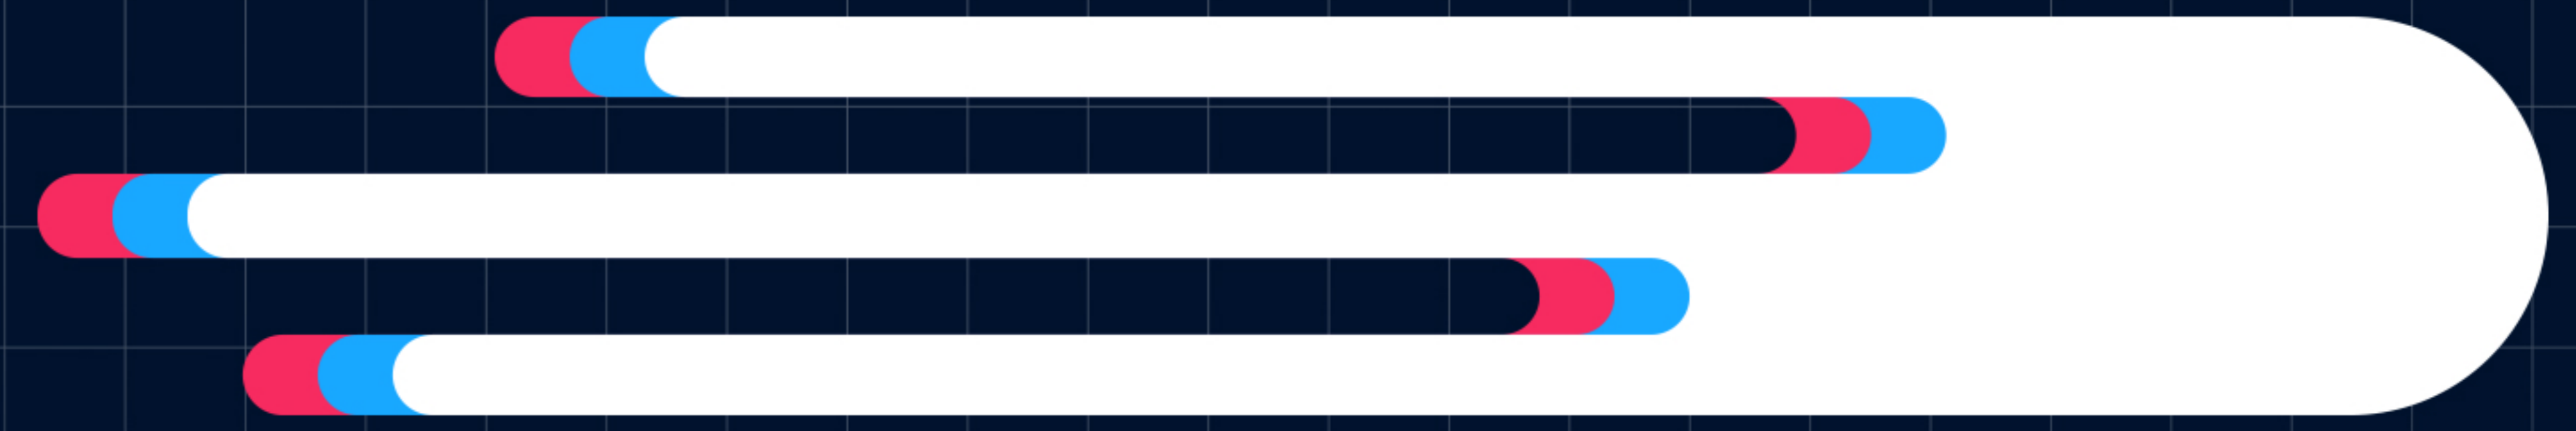

## The Problem

The problem here is manually extracting information from a large pool of data, adding it into a database and/or the preparation of a spreadsheet. It requires you to perform long, time taking and high-volume repetitive tasks. These tasks include finding the right document files out of the company's large database, sorting those documents, extracting the relevant information, and uploading that information to a new document such as excel or company system e.g. CRM.

This consumes massive amount of time and effort. Moreover, the most common mistake while extracting and entering data is mistyping. No matter how efficient, careful, and vigilant your resource is, the chances of entering erroneous information into the system is higher when doing it manually. This brings inefficiencies into the system while slowing down the pace of work being performed. It can also lead to losing a valuable resource during the hiring process by one small error.

## The Solution

Our Data Extractor bot is the solution to all of your problems related to data extraction. It makes extracting the right information from various sources much simpler and easier to do. It will also generate a separate document containing only the required information within no time as per the given criteria. The bot will go through all the relevant files and pick out just the right information according to the need and requirements. Now, you don't have to do anything except give the command and our bot will perform all the tasks and processes related to data extraction.

## Impact

Now that you have implemented our Data Extractor Bot (DEB) in your system, the following impact can be seen.

- Streamlined process
- Accuracy with the information
- Increased productivity as repetitive processes are now handed over to our DEB
- Reduced processing time
- Save time and cost
- Increased efficiency
- Zero or little errors

## Results / Outcomes

On average, a human employee takes around 3-4 minutes to go through a CV, extract specific information like name, email address, contact number, location, experience, and skills and add it into the excel file/CRM. With our DEB:

- This time is reduced to **1 second** per file/CV.
- It saves you more than **200% time** compared to manually performing this task.
- **Filtering out irrelevant** information/CVs/resumes is now a quick task and can be performed in no time.
